Columbia University

E4302 Methods in Computational Science, 2016

Outline

1 Motivation

- Why Riemann solver?
- Why Graphics Processing Unit (GPU)?

2 Objective

- Roe riemann solver for 1D Euler equation on GPU

3 Some results

- Simpler case - linear acoustic equation

Outline

1 Motivation

- Why Riemann solver?
- Why Graphics Processing Unit (GPU)?

2 Objective

- Roe riemann solver for 1D Euler equation on GPU

3 Some results

- Simpler case - linear acoustic equation

Why Riemann solver?

Riemann solver is expensive:

- The high-resolution Godunov methods, widely used finite volume methods for solving conservation law, require solution of **Riemann problem at every cell boundary** for each time step.
- If we discretize a 2D domain into 100×100 cells, we need to solve 10000 Riemann problems per time step!

- Why Riemann solver?
- Why Graphics Processing Unit (GPU)?

2 Objective

- Roe riemann solver for 1D Euler equation on GPU

3 Some results

- Simpler case - linear acoustic equation

Why Graphics Processing Unit (GPU)?

- GPU is a manycore accelerator. It has thousands of cores to process parallel workloads.
- Riemann problems from each cell boundary can be run in parallel.

2 Objective

- Roe riemann solver for 1D Euler equation on GPU

3 Some results

- Simpler case - linear acoustic equation

Roe riemann solver for 1D Euler equation on GPU

- 1D Euler equations

$$\begin{bmatrix} \rho \\ \rho u \\ E \end{bmatrix}_t + \begin{bmatrix} \rho u \\ \rho u^2 + p \\ (E + p)u \end{bmatrix}_x = 0$$

- Numerical Method:
Godunov type finite volume method with **roe's approximate riemann solver** for 1d euler riemann problem.
- Device: Intel(R) Iris(TM) Graphics 6100
- Programming Language: OpenCL
- Visualization: Visclaw

Outline

1 Motivation

- Why Riemann solver?
- Why Graphics Processing Unit (GPU)?

2 Objective

- Roe riemann solver for 1D Euler equation on GPU

3 Some results

- Simpler case - linear acoustic equation

Linear acoustic equation

- Equation -

$$\begin{bmatrix} p \\ u \end{bmatrix}_t + \begin{bmatrix} u_0 & K_0 \\ 1/\rho_0 & u_0 \end{bmatrix} \begin{bmatrix} p \\ u \end{bmatrix}_x = 0$$

→ One right going wave and one leftgoing wave with velocity $\pm \sqrt{K_0/\rho_0}$.

- OpenCL Kernels:

qinit.cl - Initialize the q array.

bc1.cl - Fill in ghost cells value for boundary condition.

acoustic_1d.cl - solve riemann problems, calculate flux between cells and update the cell value.
